Mikor a MUTE hibát kerestem, volt olyan eset is, hogy nem futott meg a kimenet és szűlt a basszus rendesen, de újból bekapcsolaskor ha nem halkítottam le a potit akkor kikapcsolt a rele, ha lehalkítottam akkor jó lett, de nagyon susogott, arra hasonlított mint amikor FM radio nincs az allomason, van egy közös mute tranzisztor az kapcsolja az összes többi, ha azt kizsáktam akkor is megmaradt a susogás, szerintem visszafelé jött valamelyik oldalról ezért szedtem ki mindegyik oldalról a tranzisztorokat, nem akartam bajlódni vele, hogy honnan jön a susogás vissza. I get my most wanted eBook Many thanks If there is a survey it only takes 5 minutes, try any survey which works for you. A triple point denotes the intersection between two particular stages in a power line. That junction is where the power distribution starts to crack down, and if it can not be repaired that would then mean the end of the line itself. While you might know what a triangle is

about a time diagram, you may not know what a triple point is. Obviously you have to comprehend the basic physics of how the wires work, but that's not the phase we're speaking about. We're talking about the physical side of this wire and all the different stages it might undergo. When a cable goes up in grade, it moves through its next stage. In the event the current going through the cable is higher than the source, it is going to go up another point. But, there are a few power lines that are rated by what they are ready to take care of. The greater the number, the more hazardous the power line would be to operate with. You see the three factors which the phase diagram ought to begin at can actually break down into more than one point. There are three points that divide into three points.

This can be called the triphased temperament of the cable, which may result in severe problems. It's essentially like if a city had a cable which ran all over the area, but each link was triphased from you to the next. Consequently, the third point begins to pull down the current, which then lowers the second one along with the third one becomes what's known as a tripped state. If the next point is tripped, the triple point is broken. Now, the present from the system is greatly reduced, which means the system will gradually become overloaded. To make things worse, when the tripped state has been reached, the lights will turn on, and the entire city's power will come outside to nothing. Now that you know about the tripped state, you will understand what to look for in a cable that you need to use. By way of instance, if your machine draws only 20 percent of the rated current, there'll be less power required to operate it. However, if your system draws 100% of their rated current, the machine will just shut down since there is not any more power to run it. Sign up just once and you can take advantage of all services.
